

- 1) Tell me about a time you faced a complicated challenge
 - S:
While I was a student at UTD, I worked on a software engineering project where my team had to take a set of requirements and turn them into a complete system design. The project involved multiple parts, including use cases, UML diagrams, system interactions, and coordinating work between several team members
 - T:
My responsibility was to make sure my portion of the project was completed correctly while also making sure it connected properly with the work the rest of the team was doing
 - A:
I broke the project into smaller pieces and focused on understanding the requirements before starting the design. I communicated with my teammates to make sure we were using the same assumptions and terminology, and when we found inconsistencies between different parts of the project, we reviewed the requirements together and corrected them before moving forward
 - R:
We were able to complete the project successfully and submit a consistent design. The experience taught me that when a problem becomes complicated, breaking it into smaller pieces and communicating early with the team makes it much easier to solve

- 2) Tell me about a time when you had to shift priorities or adapt to a sudden change quickly
 - S:
While working at Geek Squad, I had a shift where I already had several devices and customer appointments that I needed to work through. During the shift, we suddenly became much busier than expected, and we had customers coming in with issues that needed immediate attention
 - T:
I had to adjust my priorities so I could help handle the increased customer traffic while still making sure the devices and other work I was responsible for were completed on time
 - A:
I looked at my existing tasks and prioritized them based on urgency and deadlines. I handled the customers who needed immediate assistance first, communicated with my coworkers so we weren't duplicating work, and used slower periods between customers to continue working on the devices I already had assigned to me. I also made sure customers understood what to expect if there was going to be a longer wait
 - R:
We were able to handle the unexpected rush without falling too far behind, and I was still able to complete my higher-priority tasks. That experience taught me

how important it is to stay organized and flexible instead of getting stuck on the original plan when priorities suddenly change

- 3) Describe an occasion when you had to manage your time tightly to complete a complex task
 - S: At my old job we go by appointments and try to help people diagnose and solve issues with computers each appointment is meant to last around 20min
 - T: My task involved helping a customer who came in with an issue with their computer not working
 - A: The action I took even while running low on time was break down what the issue could be so I can save time on troubleshooting and figure out what the exact issue was
 - R: The result of that action was that it saved me a lot of time and I ended up resolving the issue within the appointment time
- 4) Tell me about a time you took the initiative on a project without being asked
 - S: my senior project I took the initiative by being the group leader and getting the project started
 - T: task was to help organize the team, make sure everyone understood the project requirements, and keep the group moving toward our deadlines
 - A: started by breaking the project into smaller tasks, helping assign responsibilities based on each team member's strengths, and setting up a plan for how we would communicate and track our progress
 - R: a result our team was able to stay organized, make steady progress, and complete the project successfully while avoiding confusion about responsibilities
- 5) Describe a time when you used your leadership skills to motivate your team or colleagues
 - S: my senior project at UTD there were times when the team started to feel overwhelmed because we had several tasks to complete and deadlines were getting closer
 - T: the group leader I wanted to keep everyone focused and make sure the team continued making progress without anyone feeling lost or discouraged
 - A: helped break the remaining work into smaller tasks, checked in with each team member, encouraged everyone to focus on one priority at a time, and made sure people knew they could ask for help if they were stuck
 - R: a result the team stayed organized and motivated, we continued making progress, and we were able to complete the project successfully
- 6) Tell me about a time you had to push back on a product manager or stakeholder request because it was technically unfeasible or risked system stability
 - S: During my internship at Innobit AI I worked on backend features for an AI driven video interview platform that connected multiple services including APIs and a database

- T:I had to make sure new features could be added without creating reliability issues or breaking existing parts of the system
 - A:When discussing changes I considered how they would affect the existing backend and integrations and I would bring up concerns if a request added too much complexity or could create problems with the current implementation, then I would suggest a simpler approach that still met the main goal
 - R:As a result we were able to focus on solutions that were more realistic to implement while keeping the system stable and easier to maintain
- 7)Tell me about a time you had a disagreement with a teammate and how you handled it
 - S:While working at Geek Squad I sometimes worked with other agents who had different ideas about how to troubleshoot a device or what issue should be checked first
 - T:I needed to make sure we found the actual cause of the problem while still working together effectively
 - A:I listened to their reasoning and explained what I had already tested, then we compared the results and worked through the troubleshooting process instead of arguing over which approach was correct
 - R:As a result we were usually able to narrow down the issue more efficiently and I learned that sharing troubleshooting information is more useful than becoming attached to one solution
- 8)Describe a time when you made a mistake or something did not go as planned How did you respond
 - S:While working at Geek Squad I have had situations where my initial diagnosis of a computer problem did not end up being the actual root cause
 - T:I needed to reassess the issue and find the correct solution without wasting additional time or affecting the client's data
 - A:I went back through the troubleshooting steps, reviewed what I had already tested, ruled out other possible causes, and adjusted my approach based on the new information
 - R:As a result I was able to identify the actual issue and it taught me not to assume the first likely cause is always the correct one
- 9)Tell me about a time you had to learn a new technology, tool, or skill quickly
 - S:During my internship at Innobit AI I had to work with technologies including FastAPI, Docker, MongoDB Atlas, and external APIs for an AI video interview platform
 - T:I needed to become comfortable with these technologies quickly enough to contribute to features that were being actively developed
 - A:I started by learning how each technology fit into the overall system, reviewed documentation and existing code, tested smaller examples, and then applied what I learned directly to the features I was working on
 - R:As a result I was able to contribute to backend services and integrations while becoming much more comfortable learning unfamiliar technologies in a short amount of time

- 10) Tell me about a time you received constructive feedback and how you used it to improve
 - S: During my internship at Innobit AI I worked in a development environment where code was reviewed before changes were considered complete
 - T: I needed to take feedback from code reviews and use it to improve both the feature I was working on and the quality of my future code
 - A: I reviewed the comments carefully, asked questions when something was unclear, updated my code based on the feedback, and tried to apply the same suggestions when working on later features
 - R: As a result my code became more consistent and easier to review and I became more comfortable treating feedback as part of the development process
